## 1. Delay Library APIs

### 1.1 DelayMS

<b>API</b>	DelayMS (Delay_ms)	
<b>Description</b>	This API shall create a delay in the system in milliseconds	
<b>Parameters</b>	Delay_ms	Required delay in milliseconds
<b>Returns</b>	None	

## 2. GPIO APIs

### 2.1 GPIO\_SetMode

<b>API</b>	GPIO_SetMode (GPIO_PinNumber,GPIO_Mode)	
<b>Description</b>	This API shall configure the mode of the GPIO pin	
<b>Parameters</b>	GPIO_PinNumber	Number of the GPIO pin on the target Test Bench board
	GPIO_Mode	Range : INPUT, OUTPUT, ALT0, ALT1, ALT2, ALT3, ALT4, ALT5
<b>Returns</b>	None	

### 2.2 GPIO\_Write

<b>API</b>	GPIO_Write (GPIO_PinNumber,GPIO_Level)	
<b>Description</b>	This API shall set the value of the desired GPIO pin	
<b>Parameters</b>	GPIO_PinNumber	Number of the GPIO pin on the target Test Bench board
	GPIO_Level	Range : HIGH , LOW
<b>Returns</b>	None	

### 2.3 GPIO\_Read

<b>API</b>	GPIO_Read (GPIO_PinNumber)	
<b>Description</b>	This API shall read the value of the desired GPIO pin	
<b>Parameters</b>	GPIO_PinNumber	Number of the GPIO pin on the target Test Bench board
<b>Returns</b>	Return the GPIO pin value of the Pin : gpio_pin_level	

### 2.4 GPIO\_SetPullUpDown

API	GPIO_SetPullUpDown (GPIO_PinNumber,GPIO_PullUpDown)	
Description	This API shall enable the Pull up or Pull down internal resistors	
Parameters	GPIO_PinNumber	Number of the GPIO pin on the target Test Bench board
Returns	None	

## 3. PWM APIs

### 3.1 PWM\_Configure

API	PWM_Configure (GPIO_PinNumber,PWM_Freq ,PWM_Duty)	
Description	This API shall configure the hardware PWM output pins	
Parameters	GPIO_PinNumber	Number of the GPIO pin on the target Test Bench board
	PWM_Freq	PWM desired frequency Range : 1Hz – 50KHz
	PWM_Duty	PWM desired duty cycle
Returns	None	

### 3.2 PWM\_InputInit

API	PWM_InputInit (PWM_InputPin)	
Description	This API shall initialize one of the GPIO pins as PWM input pin	
Parameters	PWM_InputPin	Number of the GPIO pin on the target Test Bench board to be configured as PWM input
Returns	None	

### 3.3 PWM\_GetDutyCycle

<b>API</b>	PWM_GetDutyCycle (PWM_InputPin)	
<b>Description</b>	This API shall read the PWM Duty cycle on one of the PWM input pins	
<b>Parameters</b>	PWM_InputPin	Number of the PWM input pin on the target Test Bench board
<b>Returns</b>	Return the Duty cycle of the PWM wave	

### 3.4 PWM\_GetFrequency

<b>API</b>	PWM_GetFrequency (PWM_InputPin)	
<b>Description</b>	This API shall read the PWM frequency on one of the PWM input pins	
<b>Parameters</b>	PWM_InputPin	Number of the PWM input pin on the target Test Bench board
<b>Returns</b>	Return the frequency of the PWM wave	

## 4. Serial Communication APIs

### 4.1 Serial\_Open

API	Serial_Open (TTY_Name, BaudRate ,SerialFlags)	
Description	This API shall open a serial port on the target Test Bench board and return a handle for the serial tty device opened at baud bits per second. The device name must start with /dev/tty or /dev/serial.	
Parameters	TTY_Name	Name of the TTY device on the Pi board
	BaudRate	Baud rate of the serial port Ranges : 50, 75, 110, 134, 150, 200, 300, 600, 1200, 1800, 2400, 4800, 9600, 19200, 38400, 57600, 115200, or 230400
	SerialFlags	0, no flags are currently defined
Returns	Return a handle for the serial tty device opened at baud bits per second.	

### 4.2 Serial\_Close

<b>API</b>	Serial_Close (Handle)	
<b>Description</b>	This API shall close a serial port on the target Test Bench board	
<b>Parameters</b>	Handle	Handle to the opened serial port on the target Test Bench board
<b>Returns</b>	None	

### 4.3 Serial\_Readbyte

<b>API</b>	Serial_Readbyte (Handle)	
<b>Description</b>	This API shall read a single byte from the desired serial port	
<b>Parameters</b>	Handle	Handle to the opened serial port on the target Test Bench board
<b>Returns</b>	Return the read serial byte	

## 4.4 Serial\_WriteByte

<b>API</b>	Serial_WriteByte (Handle, ByteVal)	
<b>Description</b>	This API shall write a single byte on the desired serial port	
<b>Parameters</b>	Handle	Handle to the opened serial port on the target Test Bench board
	ByteVal	Value of the data byte to be written on the serial port
<b>Returns</b>	None	

## 4.5 Serial\_Write

<b>API</b>	Serial_Write (Handle, Data)	
<b>Description</b>	This API shall write an array of bytes on the desired serial port	
<b>Parameters</b>	Handle	Handle to the opened serial port on the target Test Bench board
	Data	Array of data bytes to be written on the serial port
<b>Returns</b>	None	

### 4.6 Serial\_DataAvailable

API	Serial_DataAvailable (Handle, Data)	
Description	This API shall write a single byte on the desired serial port	
Parameters	Handle	Handle to the opened serial port on the target Test Bench board
Returns	Return the number of data bytes available to be read on the serial port
